

Business Sales Performance Analytics Report

Data Science & Analytics – Task 1 (2026)

By Future Interns

Prepared By: Pushp Jain

1. Project Overview

This project focuses on analysing business sales data to understand revenue trends, product performance, regional profitability, and category-wise business growth.

The objective of this analysis is to identify important business patterns and generate actionable insights that can help improve profitability, sales performance, and business decision-making.

Using sales data analytics, the project aims to answer key business questions such as:

- Which products generate maximum revenue?
- How do sales change over time?
- Which regions are most profitable?
- Which product categories contribute the most profit?
- What business improvements can be suggested?

The analysis was performed using **Power BI** to create an interactive and professional business dashboard.

2. Tools & Technologies Used

The following tools were used to complete this project:

Tool	Purpose
Power BI	Data visualization & dashboard creation
CSV Dataset	Business sales data analysis
Microsoft Word	Documentation & reporting

3. Dataset Information

For this project, the **Superstore Sales Dataset** was used.

The dataset contains important business-related information including:

- Order ID
- Order Date
- Product Name
- Category
- Region
- Sales
- Profit
- Quantity Sold
- Discount

This dataset represents a retail business scenario and helps in performing real-world business analytics.

4. Data Cleaning & Preparation

Before analysis, the dataset was cleaned and prepared to ensure accurate results.

The following preprocessing steps were performed:

4.1 Handling Data Types

- Converted **Order Date** and **Ship Date** into proper date format.
- Corrected numeric columns such as:
 - Sales
 - Profit
 - Quantity
 - Discount

4.2 Removing Errors

- Fixed incorrect date format issues using locale settings.
- Removed data inconsistencies.

4.3 Data Validation

- Verified important columns for accuracy.
- Checked for missing values and formatting issues.

This process ensured the dataset was ready for meaningful business analysis.

5. Key Performance Indicators (KPIs)

The following KPIs were analysed to understand overall business performance:

Total Sales

2.30 Million

Represents total revenue generated by the business.

Total Profit

286.40 Thousand

Represents total earnings after costs.

Total Quantity Sold

38 Thousand Units

Represents total products sold.

Total Orders

5.009 Thousand Orders

Represents the total number of customer orders processed.

6. Dashboard Analysis

The dashboard was designed to analyse business performance through multiple perspectives.

6.1 Sales Trend Over Time

The sales trend chart shows fluctuations in sales over different periods.

Observation

Sales fluctuated over time but demonstrated an overall increasing trend.

Business Insight

The company experienced growth over time despite occasional fluctuations.

Recommendation

The business should identify seasonal demand patterns and optimize marketing campaigns during high-performing periods.

6.2 Category-wise Sales Analysis

The category-wise sales analysis compares revenue generated by different product categories.

Observation

The **Technology category generated the highest sales**, while **Office Supplies and Furniture contributed comparatively lower sales**.

Business Insight

Technology products play a major role in business revenue generation.

Recommendation

The company should invest more in technology products and improve marketing strategies for lower-performing categories.

6.3 Region-wise Profit Analysis

Regional analysis was conducted to identify profitable business regions.

Observation

The **West region generated the highest profit**, while the **Central region generated the lowest profit**.

Business Insight

Regional performance varies significantly across the business.

Recommendation

The company should study successful business strategies in the West region and apply improvements to underperforming regions like Central.

6.4 Category-wise Profit Analysis

Profitability analysis helps understand which category contributes the most earnings.

Observation

The **Technology category generated the highest profit**, whereas **Furniture generated the lowest profit**.

Business Insight

Higher sales do not always lead to higher profitability.

Recommendation

The business should review pricing, discounting, and operational costs in the Furniture category.

6.5 Top 10 Products Analysis

The top-performing products were identified based on total sales.

Observation

A limited number of products contributed significantly to total revenue.

Business Insight

Certain products act as major revenue drivers for the business.

Recommendation

The company should prioritize inventory management and marketing for high-performing products.

7. Key Findings

Based on the analysis, the following findings were identified:

- 1. Technology is the highest-performing category in terms of both sales and profit.**
- 2. The West region is the most profitable business region.**
- 3. Furniture category requires improvement due to lower profitability.**

- 4. Sales fluctuate over time but show overall business growth.**
- 5. A small number of products contribute significantly to business revenue.**

8. Business Recommendations

Based on the findings, the following recommendations are suggested:

1. Increase Investment in Technology Products

Technology products are the strongest contributors to business growth and profitability.

2. Improve Central Region Performance

Investigate customer behaviour, operational efficiency, and marketing strategy in low-performing regions.

3. Review Furniture Category Strategy

Optimize discount strategies and pricing models to improve furniture profitability.

4. Focus on Top-selling Products

Maintain stock availability and increase promotions for top-performing products.

5. Use Seasonal Trend Analysis

Identify high-sales periods and optimize campaigns accordingly.

9. Conclusion

This project successfully analysed business sales performance using data analytics and visualization techniques.

Through KPI analysis, category analysis, regional performance evaluation, and product trend analysis, valuable business insights were generated.

The dashboard helps stakeholders understand business performance and supports better decision-making through data-driven recommendations.

Overall, this project demonstrates how business analytics can be used to improve revenue, profitability, and operational strategy.
